

# PDF Classifier

By: Matthew Wong

# Motivation

- ❑ Businesses get hundreds of PDFs
- ❑ PDFs are sorted by employees
- ❑ Takes a lot of time and costs money
- ❑ Goal: Classify PDFs

# Data

- ❏ 14 different classifications
  - ❏ Appraisal
  - ❏ Income
  - ❏ Insurance
- ❏ ~700 documents and uneven classes
- ❏ PDFs in each classification vary
  - ❏ Forms
  - ❏ Scans
  - ❏ Faxes

# Text Extraction

- ❑ PDFminer
  - ❑ Works well for PDFs with text layers
  - ❑ Much quicker than PyOCR
- ❑ PyOCR (python wrapper for Tesseract)
  - ❑ Works well for most PDFs
  - ❑ Takes a long time

# Different Models

## Naive Bayes

Simpler NLP model

Worked well for some categories and not so great with others

## TF-IDF

Average Cosine Similarity

Tried to capture signal from variation in documents of the same category

## TF-IDF

kNN Cosine Similarity

Only looked at the n most similar documents

# Cross Validated Accuracy

- ❑ Used Stratified Cross Validation due to uneven classes

## Naive Bayes

PDFminer:

~ 0.58

PDFminer and PyOCR:

~0.62

PyOCR:

~0.48

## Average Cosine Similarity

PDFminer:

~ 0.67

PDFminer and PyOCR:

~0.75

PyOCR:

~0.67

## kNN Cosine Similarity

PDFminer:

~ 0.73

PDFminer and PyOCR:

~0.84

PyOCR:

~0.83

# Future Work

- ❑ Renaming/Filing documents automatically
- ❑ Extracting specific text strings
  - ❑ Name
  - ❑ Address
  - ❑ \$\$\$ Values

# Thank You Questions?
